Quick Start Steps

1) Install good batteries and turn power on (see pages 5 and 6).
2) Set compatibility mode to match the receiver (see page 9).
3) Connect signal source and adjust input gain for optimum modulation level (see page 9).
4) Set **StepSize** and frequency to match receiver (see page 10). Also see receiver manual for scanning procedure.
5) Turn on the receiver and verify RF and audio signals are present (see receiver manual).

Introduction

The design of the LMb transmitter delivers the advanced technology and features of Digital Hybrid Wireless® in a Lectrosonics belt-pack transmitter at a modest cost. Digital Hybrid Wireless® combines a 24-bit digital audio chain with an analog FM radio link to eliminate a compandor and its artifacts, yet preserve the extended operating range and noise rejection of the finest analog wireless systems. Along with providing peerless audio quality with wide frequency response and dynamic range in Nu Hybrid mode, the technology used in the LMb includes compatibility modes for Lectrosonics Mode 3 and IFB receivers.

The housing is a rugged, machined aluminum package with removable, stainless steel wire belt clip. The input jack is a standard Lectrosonics 5-pin type for use with electret lavalier and dynamic mics, dynamic mics, musical instrument pickups and line level signals. The LEDs on the top panel allow quick and accurate level settings without having to view the receiver. The unit is powered by two AA batteries. The antenna is a super-rugged, permanently attached 1/4 wavelength design made of flexible galvanized steel cable.

The switching power supplies in the LMb provide constant voltages to the transmitter circuits from the beginning to the end of battery life, with output power remaining constant over the life of the battery. The input amplifier uses an ultra low noise op amp for quiet operation. Input gain is adjustable over a 44 dB range, with a DSP-controlled dual envelope input limiter to cleanly handle signal peaks over 30 dB above full modulation.

About Digital Hybrid Wireless

All wireless links suffer from channel noise to some degree, and all wireless microphone systems seek to minimize the impact of that noise on the desired signal. Conventional analog systems use compressors for enhanced dynamic range, at the cost of subtle artifacts (known as “pumping” and “breathing”). Wholly digital systems defeat the noise by sending the audio information in digital form, at the cost of some combination of power, bandwidth, operating range and resistance to interference.

The Lectrosonics Digital Hybrid Wireless® system overcomes channel noise in a dramatically new way, digitally encoding the audio in the transmitter and decoding it in the receiver, yet still sending the encoded information over an analog FM wireless link. This proprietary algorithm is not a digital implementation of an analog compandor but a technique which can be accomplished only in the digital domain.

Since the RF link between transmitter and receiver is FM, channel noise will increase gradually with increased operating range and weak signal conditions, however, the Digital Hybrid Wireless system handles this situation elegantly with rarely audible audio artifacts as the receiver approaches its squelch threshold. In contrast, a purely digital system tends to drop the audio suddenly during brief dropouts and weak signal conditions. The Digital Hybrid Wireless® system simply encodes the signal to use a noisy channel as efficiently and robustly as possible, yielding audio performance that rivals that of purely digital systems, without the power, noise and bandwidth problems inherent in digital transmission. Because it uses an analog FM link, Digital Hybrid Wireless® enjoys all the benefits of conventional FM wireless systems, such as excellent range, efficient use of RF spectrum, and long battery life.

Frequency Agility

Frequency agility is provided in 100 kHz or 25 kHz steps. Frequencies are displayed on the LCD in MHz and in a hex code used with earlier Lectrosonics equipment.

Servo Bias Input and Wiring

The LMb input preamp is a unique design that delivers audible improvements over conventional transmitter inputs. The transmitters are easier to use and much harder to overload. It is not necessary to introduce pads on some mics to prevent overload of the input stage, divide the bias voltage down for some low level mics, or reduce the limiter range at minimum gain settings.

Two different microphone wiring schemes are available to simplify and standardize the configuration. Simplified 2-wire and 3-wire configurations provide several arrangements designed for use only with servo bias inputs to take full advantage of the preamp circuitry. Other wiring schemes are compatible with Servo Bias and conventional inputs.

A line level input wiring provides an extended frequency response with an LF roll-off at 35 Hz for use with instruments and line level signal sources.

DSP-controlled Input Limiter

The transmitter employs a digitally-controlled analog audio limiter prior to the analog-to-digital converter. The limiter has a range greater than 30 dB for excellent overload protection. A dual release envelope makes the limiter acoustically transparent while maintaining low distortion. It can be thought of as two limiters in series, connected as a fast attack and release limiter followed by a slow attack and release limiter. The limiter recovers quickly from brief transients, so that its action is hidden from the listener, but recovers slowly from sustained high levels to keep audio distortion low and preserve short term dynamic changes in the audio.
No Pre-Emphasis/De-Emphasis

Because the signal to noise ratio of the Digital Hybrid Wireless® system is so high, there is no need for conventional pre-emphasis (HF boost) in the transmitter and de-emphasis (HF roll off) in the receiver. Thus, the potential distortion problems associated with pre-emphasis and de-emphasis are eliminated.

Pilot Tone Squelch

The **squelch** system in a receiver is a method of muting the audio when the RF signal conditions are too poor to produce usable audio. While not all squelch systems work the same way, the goal is always the same: to discard noise and unusable audio.

The Digital Hybrid Wireless system employs a DSP-generated supersonic tone (pilot tone), using it as a kind of signature, so the receiver can mute even strong signals that aren’t from the appropriate transmitter. The pilot tone also helps to ensure that the receiver is quiet when the transmitter is turned on and off.

256 different pilot tones provide reliable operation in multi-channel wireless systems. A different tone is generated every 100 kHz across the tuning range of the system, so that a tone is not repeated until it is 25.6 MHz above or below the previous one.

LMb Block Diagram

- **Servo Bias Supply**: Supplies bias voltage (0, 2, or 4V) to other components.
- **Gain Adj**: Adjusts the gain of the signal.
- **Input Jack**: Receives audio input.
- **Shunt Limiter**: Helps limit the signal to prevent distortion.
- **Input Preamp**: Enhances the input signal.
- **Bias Voltage**: Essential for proper operation.
- **A-D Converter**: Converts analog to digital signal.
- **11001001**: A specific model or number for the converter.
- **D-A Converter**: Converts digital to analog signal.
- **I2S**: Interface for transmission.
- **encoded audio and pilot tone**: Provides encoded audio and pilot tone.
- **PLL Ref**: Phase Locked Loop Reference.
- **Voltage Controlled Oscillator**: Controls the output frequency.
- **Driver**: Drives the final amplifier.
- **Final Amplifier**: Amplifies the signal for transmission.
- **Oscillator**: Provides a stable frequency for the system.
- **Micro Clock**: Provides a timing reference.
- **Microprocessor**: Controls the overall operation of the system.
- **Bicolor Modulation LEDs**: Displays status information.
- **Tricolor Power LED**: Indicates power status.
- **AUDIOS**: Audio signals are sent through various stages.
- **D-A Converter**: Converts digital to analog signal.
- **A-D Converter**: Converts analog to digital signal.
- **Gain Adj**: Adjusts the gain of the signal.
- **Bias Voltage**: Essential for proper operation.
- **Input Jack**: Receives audio input.
- **Shunt Limiter**: Helps limit the signal to prevent distortion.
- **Input Preamp**: Enhances the input signal.
- **Servo Bias Supply**: Supplies bias voltage (0, 2, or 4V) to other components.
- **Bias Voltage**: Essential for proper operation.
- **11001001**: A specific model or number for the converter.
- **D-A Converter**: Converts digital to analog signal.
- **I2S**: Interface for transmission.
- **encoded audio and pilot tone**: Provides encoded audio and pilot tone.
- **PLL Ref**: Phase Locked Loop Reference.
- **Voltage Controlled Oscillator**: Controls the output frequency.
- **Driver**: Drives the final amplifier.
- **Final Amplifier**: Amplifies the signal for transmission.
- **Oscillator**: Provides a stable frequency for the system.
- **Micro Clock**: Provides a timing reference.
- **Microprocessor**: Controls the overall operation of the system.
- **Bicolor Modulation LEDs**: Displays status information.
- **Tricolor Power LED**: Indicates power status.
- **AUDIOS**: Audio signals are sent through various stages.
Battery Installation

The transmitter is powered by two AA batteries. We recommend using alkaline, lithium, or rechargeable batteries for longest life. Standard zinc-carbon batteries marked “heavy-duty” or “long-lasting” are not adequate.

The battery status circuitry compensates for the difference in voltage drop between alkaline and lithium batteries across their usable life, so it’s important to select the correct battery type in the menu.

Because rechargeable batteries run down quite abruptly, using the Power LED to verify battery status will not be reliable. However, it is possible to track battery status using the Battery Timer function available in Lectrosonics Digital Hybrid Wireless® receivers.

Push outward on the Battery Compartment Door and lift it to open.

Insert the batteries according to the markings inside the battery compartment.

If the batteries are inserted incorrectly, the door will close but the unit will not operate.

The battery contacts can be cleaned with alcohol and a cotton swab, or a clean pencil eraser. Be sure not to leave any remnants of the cotton swab or eraser crumbs inside the compartment.

Belt Clips

The wire belt clip may be removed by pulling the ends out of the holes in the sides of the case. Use pliers to grasp the wire and avoid scratching the surface of the housing. Pliers also help when installing the clip.

An optional spring-loaded, hinged belt clip (model number BCSLEBN) is also available. This clip is attached by removing the plastic hole cap on the back of the housing and mounting the clip with the supplied screw.
Operating Instructions

Battery Status LED Indicators

Alkaline, lithium or rechargeable batteries can be used to power the transmitter. The type of batteries in use are selectable in a menu on the LCD.

When alkaline or lithium batteries are being used, the LED labeled BATT on the keypad glows green when the batteries are good. The color changes to red when they are nearing the end of life. When the LED begins to blink red, there will be only a few minutes remaining.

The exact point at which the LEDs turn red will vary with battery brand and condition, temperature and power consumption. The LEDs are intended to simply catch your attention, not to be an exact indicator of remaining time.

A weak battery will sometimes cause the LEDs to glow green immediately after the transmitter is turned on, but it will soon discharge to the point where the LED will turn red or the unit will turn off completely.

Rechargeable batteries give little or no warning when they are depleted. If you wish to use these batteries in the transmitter, you will need to manually keep track of the operating time to prevent interruptions caused by dead batteries. Many Lectrosonics receivers have a timer function to keep track of battery runtime.

The Power/Function LED on the top panel will mirror the keypad LED unless the programmable switch is set to the Mute or Talkback mode, and the switch is turned on.

Powering On in Operating Mode

Press and hold the Power Button for several seconds until a counter on the LCD progresses from 1 through 3, followed by a display of the model, firmware version, frequency band and compatibility mode.

When you release the button, the unit will be operational with the RF output turned on and the Main Window displayed. Only the second and third screens will appear when the programmable function switch is used to turn on the power.
Powering On in Standby Mode

A brief press of the Power Button ②, releasing it before the counter has reached 3, will turn the unit on with the RF output turned off. In this Standby Mode, the menus can be browsed to make settings and adjustments without the risk of interfering with other wireless systems nearby.

Hold for RF On

...1

RF indicator blinks

Release Power Button before the counter reaches 3 to enter standby mode

After settings and adjustments are made, press the power button again to turn the unit off.

NOTE: Also see the section entitled Power Menu for the AutoOn feature.

Powering Off

From any screen, power can be turned off by selecting Pwr Off in the power menu or holding the Power Button ② in and waiting for the countdown, EXCEPT if the top panel switch is configured for this function.

If the power button is released, or the top panel switch is turned back on again before the countdown is completed, the unit will remain turned on and the LCD will return to the same screen or menu that was displayed previously.

NOTE: When the top panel switch is configured as a power switch, that is the only way to turn the unit off.

Navigating Menus

The LCD and keypad interface make it easy to browse the menus and make the selections for the setup the user needs. When the unit is powered up in either the operating or the standby mode, press MENU/SEL on the keypad to enter a menu structure on the LCD. Use the ③ and ④ arrow buttons to select the menu item. Then press the MENU/SEL button to enter the menu.

The prompt in the upper right corner may display one or both arrows, depending upon what adjustment can be made. If the changes are locked, a small padlock symbol will appear.

Locking/Unlocking Changes to Settings

Changes to the settings can be locked.

When changes are locked, several controls and actions can still be used:

- Settings can still be unlocked
- Menus can still be browsed
- Programmable switch still works
- Power can still be turned off by using the power menu or removing the batteries.

Power Menu

Pressing the power button when the unit is turned on will display a menu with several options:

- Resume - returns to the previous mode and screen
- Pwr Off - turns the unit off irrevocably
- Rf On? - enters a screen to enable the operating or standby modes
- AutoOn? - allows the unit to automatically turn back on after a power failure or when fresh batteries are installed (works in the operating mode only)
- Backlit - adjusts the duration of the LCD back light to 30 seconds or 5 minutes, or to remain on
- LED Off - turns the LEDs on (Normal) or off (Dark)
- About - displays the installed firmware version.
Selecting Programmable Switch Functions

The programmable switch on the top panel can be configured using the menu to provide several functions:

- **Power** - turns the power on and off
- **Mute** - mutes the audio when switched on
- **TalkBk** (talkback) - redirects the audio to a different output channel on the receiver (with receivers that offer this function)
- **(none)** - disables the switch

Changing the step size never changes the frequency. It only changes the way the user interface works. If the frequency is set to a fractional increment between even 100 kHz steps and the step size is changed to 100 kHz, the hex code will be replaced by two asterisks on the main screen and the frequency screen.

Main Window Indicators

The Main Window displays the band number, Standby or Operating mode, operating frequency, audio level, battery status and programmable switch function. When the frequency step size is set at 100 kHz, the LCD will look like the following.

- **Band number**
- **Operating mode**
- **Frequency (hex setting)**
- **Battery status**
- **Programmable switch function**

When the frequency step size is set to 25 kHz, the hex number is smaller and may include a fraction.

- **Fraction**
  - 1/4 = .025 MHz
  - 1/2 = .050 MHz
  - 3/4 = .075 MHz

Changing the step size never changes the frequency. It only changes the way the user interface works. If the frequency is set to a fractional increment between even 100 kHz steps and the step size is changed to 100 kHz, the hex code will be replaced by two asterisks on the main screen and the frequency screen.

**Frequency set to fractional 25 kHz step, but step size changed to 100 kHz.**

If the programmable switch function is set for Mute, the Main Window will indicate that the function is enabled.

When the switch is turned on, the mute icon appearance will change, the word MUTE will blink at the bottom of the display, and the power/function LED will blink blue.

If the programmable switch function is set for Talkback, the Main Window will indicate that the function is enabled but not active.

When the programmable switch is turned on, the talkback icon appearance will change and the power/function LED will glow blue.
Selecting the Compatibility (Compat) Mode

When used with a Lectrosonics Digital Hybrid Wireless® receiver, the best audio quality will be achieved with the system set to the Nu Hybrid compatibility mode.

Use the UP and DOWN arrows to select the desired mode, then press the BACK button twice to return to the Main Window.

Compatibility modes are as follows:

- **Mode 3:** works with certain non-Lectrosonics models.
- **Nu Hybrid** works with all Lectrosonics Digital Hybrid receivers. The receiver must also be set to the Nu Hybrid compatibility mode.
- **IFB Series** works with Lectrosonics IFB R1/R1a analog receivers.

* Contact the factory for details of this mode

Connecting the Signal Source

Microphones, line level audio sources and instruments can be used with the transmitter. Refer to the section entitled Wiring Hookups for Different Sources for details on the correct wiring for microphones to take full advantage of the Servo Bias circuitry.

Adjusting the Input Gain

The two bicolor Modulation LEDs on the control panel and keypad provide a visual indication of the audio signal level entering the transmitter. The LEDs will glow either red or green to indicate modulation levels as shown in the following table.

<table>
<thead>
<tr>
<th>Signal Level</th>
<th>-20 LED</th>
<th>-10 LED</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than -20 dB</td>
<td><em>Off</em></td>
<td><em>Off</em></td>
</tr>
<tr>
<td>-20 dB to -10 dB</td>
<td><em>Green</em></td>
<td><em>Off</em></td>
</tr>
<tr>
<td>-10 dB to +0 dB</td>
<td><em>Green</em></td>
<td><em>Green</em></td>
</tr>
<tr>
<td>+0 dB to +10 dB</td>
<td><em>Red</em></td>
<td><em>Green</em></td>
</tr>
<tr>
<td>Greater than +10 dB</td>
<td><em>Red</em></td>
<td><em>Red</em></td>
</tr>
</tbody>
</table>

NOTE: Full modulation is achieved at 0 dB, when the “-20” LED first turns red. The limiter can cleanly handle peaks up to 30 dB above this point.

It is best to go through the following procedure with the transmitter in the standby mode so that no audio will enter the sound system or recorder during adjustment.

1) With fresh batteries in the transmitter, power the unit on in the standby mode (see previous section Powering On in Standby Mode).
2) Navigate to the Gain setup screen.
3) Prepare the signal source. Position a microphone the way it will be used in actual operation and have the user speak or sing at the loudest level that occur during use, or set the output level of the instrument or audio device to the maximum level that will be used.
4) Use the and arrow buttons to adjust the gain until the –10 dB glows green and the –20 dB LED starts to flicker red during the loudest peaks in the audio.
5) Once the audio gain has been set, the signal can be sent through the sound system for overall level adjustments, monitor settings, etc.
6) If the audio output level of the receiver is too high or low, use only the controls on the receiver to make adjustments. Always leave the transmitter gain adjustment set according to these instructions, and do not change it to adjust the audio output level of the receiver.

Selecting Step Size

This menu item allows frequencies to be selected in either 100 kHz or 25 kHz increments.

If the desired frequency ends in .025, .050 or .075 MHz, the 25 kHz step size must be selected.

Normally, the receiver is used to find a clear operating frequency. All Lectrosonics Digital Hybrid Wireless® receivers provide a scanning function to quickly and easily find prospective frequencies with little or no RF interference. In other cases, a frequency may be specified by officials at a large event such as the Olympics or a major league ball game. Once the frequency is determined, set the transmitter to match the associated receiver.
Selecting Frequency

The setup screen for frequency selection offers several ways to browse the available frequencies.

Each field will step through the available frequencies in a different increment. The increments are also different in the 25 kHz mode from the 100 kHz mode.

A fraction will appear next to the hex code in the setup screen and in the main window when the frequency ends in .025, .050 or .075 MHz.

Selected Frequency Using Two Buttons

Hold the MENU/SEL button in, then use the  and  arrow buttons for alternate increments.

Helpful Features on Receivers

To aid in finding clear frequencies, several Lectrosonics receivers offer a SmartTune feature that scans the tuning range of the receiver and displays a graphical report that shows where RF signals are present at different levels, and areas where there is little or no RF energy present. The software then automatically selects the best channel for operation.

Lectrosonics receivers equipped with an IR Sync function allow the receiver to set frequency, step size and compatibility modes on the transmitter via an infrared link between the two units.

About Overlapping Frequency Bands

When two frequency bands overlap, it is possible to select the same frequency at the upper end of one and the lower end of the other. While the frequency will be the same, the pilot tones will be different, as indicated by the hex codes that appear.

In the following examples, the frequency is set to 494.500 MHz, but one is in band 470 and the other in band 19. This is done intentionally to maintain compatibility with receivers that tune across a single band. The band number and hex code must match the receiver to enable the correct pilot tone.

Make sure the band number and hex code match the receiver setting.
Selecting Audio Polarity (Phase)
Audio polarity can be inverted at the transmitter so the audio can be mixed with other microphones without comb filtering. The polarity can also be inverted at the receiver outputs.

Adjusting LCD Backlight
For viewing the LCD in dimly lit conditions, the backlight can be turned on continuously or set to turn off automatically after either 30 seconds or 5 minutes.

RF ON/OFF on the Menu
The RF output of the transmitter can be turned off and on with a menu item on the LCD to switch from the standby mode to the operating mode.

Selecting Battery Type
The voltage drop over the life of different batteries varies by type and brand. Be sure to set the correct battery type for accurate indications and warnings. The menu offers alkaline or lithium types.

If you are using rechargeable batteries, it is better to use the timer function on the receiver to monitor the battery life rather than the indicators on the transmitter. Rechargeable batteries maintain a fairly constant voltage across the operating time on each charge and stop working abruptly, so you will have little or no warning as they reach the end of operation. The timer is available on all Lectrosonics Digital Hybrid Wireless® receivers.

Restoring Default Settings
This is used to restore the factory settings.

IR (infrared) Sync
The opening on the side panel is an IR port for quick setup using a receiver with this capability. The transfer is initiated with a switch on the receiver.

The receiver can transfer the settings for Frequency, Step Size and Compatibility mode to the transmitter via the IR ports. When the settings are successfully transferred, OK will appear on the transmitter LCD. If a mismatch exists, an error message will appear on the transmitter LCD indicating the nature of the problem.
5-Pin Input Jack Wiring

The wiring diagrams included in this section represent the basic wiring necessary for the most common types of microphones and other audio inputs. Some microphones may require extra jumpers or a slight variation on the diagrams shown.

It is virtually impossible to keep completely up to date on changes that other manufacturers make to their products, thus you may encounter a microphone that differs from these instructions. If this occurs please call our toll-free number listed under Service and Repair in this manual or visit our web site at: www.lectrosonics.com

Audio input jack wiring:

**PIN 1**
Shield (ground) for positive biased electret lavaliere microphones. Shield (ground) for dynamic microphones and line level inputs.

**PIN 2**
Bias voltage source for positive biased electret lavaliere microphones that are not using servo bias circuitry and voltage source for 4 volt servo bias wiring.

**PIN 3**
Microphone level input and bias supply.

**PIN 4**
Bias voltage selector for Pin 3. Pin 3 voltage depends on Pin 4 connection.

- Pin 4 tied to Pin 1: 0 V
- Pin 4 Open: 2 V
- Pin 4 to Pin 2: 4 V

**PIN 5**
Line level input for tape decks, mixer outputs, musical instruments, etc.

Installing the Connector:

1) If necessary, remove the old connector from the microphone cable.
2) Slide the dust boot onto microphone cable with the large end facing the connector.
3) If necessary, slide the 1/8-inch black shrink tubing onto the microphone cable. This tubing is needed for some smaller diameter cables to ensure there is a snug fit in the dust boot.
4) Slide the backshell over the cable as shown above. Slide the insulator over the cable before soldering the wires to the pins on the insert.
5) Solder the wires and resistors to the pins on the insert according to the diagrams shown in *Wiring Hookups for Different Sources*. A length of .065 OD clear tubing is included if you need to insulate the resistor leads or shield wire.
6) If necessary, remove the rubber strain relief from the TA5F backshell by simply pulling it out.
7) Seat the insulator on the insert. Slide the cable clamp over the end of the insulator and crimp as shown on the next page.
8) Insert the assembled insert/insulator/clamp into the latchlock. Make sure the tab and slot align to allow the insert to fully seat in the latchlock. Thread the backshell onto the latchlock.
Microphone Cable Termination for Non-Lectrosonics Microphones

TA5F Connector Assembly

Mic Cord Stripping Instructions

VIEW FROM SOLDER SIDE OF PINS

Crimping to Shield and Insulation

Strip and position the cable so that the clamp can be crimped to contact both the mic cable shield and the insulation. The shield contact reduces noise with some microphones and the insulation clamp increases ruggedness.

NOTE: This termination is intended for UHF transmitters only. VHF transmitters with 5-pin jacks require a different termination. Lectrosonics lavalier microphones are terminated for compatibility with VHF and UHF transmitters, which is different from what is shown here.
Input Jack Wiring for Different Sources

In addition to the microphone and line level wiring hook-ups illustrated below, Lectrosonics makes a number of cables and adapters for other situations such as connecting musical instruments (guitars, bass guitars, etc.) to the transmitter. Visit [www.lectrosonics.com](http://www.lectrosonics.com) and click on Accessories, or download the master catalog.

A lot of information regarding microphone wiring is also available in the FAQ section of the web site at: [http://www.lectrosonics.com](http://www.lectrosonics.com)

Hover over Support and click on FAQs. Follow the instructions to search by model number or other search options.

### Compatible Wiring for Both Servo Bias Inputs and Earlier Transmitters:

#### 2 VOLT POSITIVE BIAS 2-WIRE ELECTRET

![Fig. 1](image1)

Compatible wiring for microphones such as Countryman E8 headworn and BM lavalier.

**WIRING FOR LECTROSONICS M152/5P**

![Fig. 5](image5)

The M152 lavaliere microphone has an internal resistor and can be wired in a 2-wire configuration. This is the factory standard wiring.

#### 4 VOLT POSITIVE BIAS 2-WIRE ELECTRET

![Fig. 2](image2)

Most common type of wiring for lavaliere mics.

#### 2 VOLT NEGATIVE BIAS 2-WIRE ELECTRET

![Fig. 4](image4)

Compatible wiring for microphones such as negative bias TRAM models.

**NOTE:** The resistor value can range from 2k to 4k ohms. Same as DPA adapter DAD3056

#### DANISH PRO AUDIO MINIATURE MODELS

![Fig. 3](image3)

This wiring is for DPA lavalier and headset microphones.

**NOTE:** The resistor value can range from 3k to 4k ohms.

#### LO-Z MICROPHONE LEVEL SIGNALS

![Fig. 6](image6)

For low impedance dynamic mics or electret mics with internal battery or power supply.

Insert 1k resistor in series with pin 3 if attenuation is needed

#### BALANCED AND FLOATING LINE LEVEL SIGNALS

![Fig. 7](image7)

*NOTE:* If the output is balanced but center tapped to ground, such as on all Lectrosonics receivers, do not connect Pin 3 of the XLR jack to Pin 4 of the TA5F connector.

#### UNBALANCED LINE LEVEL SIGNALS

![Fig. 8](image8)

For signal levels up to 3V (+12 dBu) before limiting. Fully compatible with 5-pin inputs on other Lectrosonics transmitters such as the LM and UM Series. A 20k ohm resistor can be inserted in series with Pin 5 for an additional 20 dB of attenuation to handle up to 30V (+32 dBu).

#### Simple Wiring - Can ONLY be used with Servo Bias Inputs:

Servo Bias was introduced in 2005 and all transmitters with 5-pin inputs have been built with this feature since 2007.

#### 2 VOLT POSITIVE BIAS 2-WIRE ELECTRET

![Fig. 9](image9)

Simplified wiring for microphones such as Countryman BM microphone and BM Headset models and others.

**NOTE:** This servo bias wiring is not compatible with earlier versions of Lectrosonics transmitters. Check with the factory to confirm which models can use this wiring.

#### 2 VOLT NEGATIVE BIAS 2-WIRE ELECTRET

![Fig. 10](image10)

Simplified wiring for microphones such as negative bias TRAM.

**NOTE:** This servo bias wiring is not compatible with earlier versions of Lectrosonics transmitters. Check with the factory to confirm which models can use this wiring.

#### 4 VOLT POSITIVE BIAS 3-WIRE ELECTRET

![Fig. 11](image11)

Also used for other 3-wire lavaliere microphones that require an external resistor.

**NOTE:** This servo bias wiring is not compatible with earlier versions of Lectrosonics transmitters. Check with the factory to confirm which models can use this wiring.
Microphone RF Bypassing

When used on a wireless transmitter, the microphone element is in the proximity of the RF coming from the transmitter. The nature of electret microphones makes them sensitive to RF, which can cause problems with microphone/transmitter compatibility. If the electret microphone is not designed properly for use with wireless transmitters, it may be necessary to install a chip capacitor in the mic capsule or connector to block the RF from entering the electret capsule.

Some mics require RF protection to keep the radio signal from affecting the capsule, even though the transmitter input circuitry is already RF bypassed.

If the mic is wired as directed, and you are having difficulty with squealing, high noise, or poor frequency response, RF is likely to be the cause.

The best RF protection is accomplished by installing RF bypass capacitors at the mic capsule. If this is not possible, or if you are still having problems, capacitors can be installed on the mic pins inside the TA5F connector housing. Refer to the diagram below for the correct locations of capacitors.

Use 330 pF capacitors. Capacitors are available from Lectrosonics. Please specify the part number for the desired lead style.

Labeled capacitors: P/N 15117
Labeled capacitors: P/N SCC330P

All Lectrosonics lavaliere mics are already bypassed and do not need any additional capacitors installed for proper operation.

Line Level Signals

The normal wiring for line level signals is:
- Signal Hot to pin 5
- Signal Gnd to pin 1
- Pin 4 jumped to pin 1

This allows signal levels up to 3V RMS to be applied without limiting.

If more headroom is needed, insert a 20 k resistor in series with pin 5. Put this resistor inside the TA5F connector to minimize noise pickup.

Wiring Diagram for MI39A Instrument Cable

The MI39ARA and MI39AST instrument cable assemblies allow an optimum match between musical instrument pickups and Lectrosonics transmitters with 5-pin input connectors.

The cables are wired to provide an extended low frequency response with a roll-off at 35 Hz.

Note: This cable is prewired and cannot be field modified. The cable is available in two configurations, MI39ARA (right angle 1/4” plug) and MI39AST (straight 1/4” plug).

Troubleshooting

Symptom:

Transmitter Battery LED off when Power Switch “ON”

Possibility: 1. Batteries are inserted incorrectly.
2. Batteries are low or dead.

No Transmitter Modulation LEDs when Signal Should be Present

1. Gain control turned all the way down.
2. Batteries are inserted incorrectly. Check power LED.
3. Mic capsule is damaged or malfunctioning.
4. Mic cable damaged or miswired.
5. Instrument Cable damaged or not plugged in.

Receiver Indicates RF But No Audio

1. Audio source or cable connected to transmitter is defective. Try using an alternate source or cable.
2. Make sure the compatibility mode is the same on transmitter and receiver.
3. Ensure musical instrument volume control is not set to minimum.
4. Check for correct pilot tone indication on the receiver. See item on page 11 entitled About Overlapping Frequency Bands.

Receiver RF Indicator Off

1. Ensure that the transmitter and receiver are set to the same frequency, and that the hex code matches.
2. Transmitter not turned on, or battery is dead.
3. Receiver antenna missing or improperly positioned.
4. Operating distance is too great.
5. Transmitter may be set to the Standby Mode. See page 7.

No Sound (Or Low Sound Level), Receiver Indicates Proper Audio Modulation

1. Receiver output level set too low.
2. Receiver output is disconnected; cable is defective or miswired.
3. Sound system or recorder input is turned down.

Distorted Sound

1. Transmitter gain (audio level) too high. Check Modulation LEDs on transmitter and receiver while distortion is being heard.
2. Receiver output level may be mismatched with the sound system or recorder input. Adjust output level on receiver to the correct level for the recorder, mixer or sound system.
3. Transmitter and receiver may not be set to the same compatibility mode. Some mis-matched combinations will pass audio.
4. RF interference. Reset both transmitter and receiver to a clear channel. Use scanning function on receiver if available.

Wind Noise or Breath “Pops”

1. Reposition microphone, or use a larger windscreen, or both.
2. Omni-directional mics produce less wind noise and breath pops than directional types.

Hiss and Noise -- Audible Dropouts

1. Transmitter gain (audio level) far too low.
2. Receiver antenna missing or obstructed.
3. Operating distance too great.
4. RF interference. Reset both transmitter and receiver to a clear channel. Use scanning function on receiver if available.
5. Musical instrument output set too low.
6. Microphone capsule picking up RF noise. See item on page 15 entitled Microphone RF Bypassing.

Excessive Feedback (With Microphone)

1. Transmitter gain (audio level) too high. Check gain adjustment and/or reduce receiver output level.
2. Microphone too close to speaker system.
3. Microphone is too far from user’s mouth.

It is important that you follow these steps in the sequence listed.
Specifications and Features

Operating Frequencies:
Band A1: 470.100 - 537.575
Band B1: 537.600 - 607.950

Frequency Selection Steps: Selectable; 100 kHz or 25 kHz
RF Power output: 50 mW
Compatibility Modes (3) Nu Hybrid, Mode 3, IFB
Pilot tone: 3.5 kHz deviation (Nu Hybrid)
Frequency Stability: ± 0.002%
Spurious radiation: Compliant with ETSI EN 300 422-1 v1.4.2
Equivalent input noise: –120 dBV (A-weighted)
Input level: Nominal 2 mV to 300 mV, before limiting
                       Greater than 1V maximum, with limiting
Input impedance: 2k Ohm
Input limiter: DSP controlled, dual envelope “soft” limiter
               with greater than 30 dB range
Gain control range: 44 dB; digital control
Modulation indicators: • Dual bicolor LEDs indicate modulation of
                       -20, -10, 0 and +10 dB referenced to full
                       modulation
                       • LCD bar graph

Audio Performance (Nu Hybrid mode)
Frequency Response: 90 Hz to 20 kHz (+/-1dB)
Low frequency roll-off: –12 dB/octave; 70 Hz
THD: 0.2% (typical)
SNR at receiver output:
Note: The dual envelope “soft”
limiter provides exceptionally good
handling of transients using variable
attack and release time constants. Once activated, the limiter compresses 30+ dB
of transmitter input range into 4.5 dB of receiver output range, thus reducing the
measured figure for SNR without limiting by 4.5 dB

Controls: • Top panel slide switch; programmable as power, mute, talkback or no (off) function
Billy side panel membrane switches with LCD
           interface for power on/off and all setup and
           configuration controls

Audio Input Jack: Switchcraft 5-pin locking (TA5F)
Antenna: Galvanized steel, flexible wire
Battery: Two AA lithium
Battery Life: Duracell Quantum: 7 hours
Weight: 5 ounces (141 grams), including lithium
AA batteries and wire belt clip
Dimensions: 3.2 x 2.4 x .8 in. (81 x 61 x 20 mm)
Emission Designator: 110KF3E

Specifications subject to change without notice.
Service and Repair

If your system malfunctions, you should attempt to correct or isolate the trouble before concluding that the equipment needs repair. Make sure you have followed the setup procedure and operating instructions. Check the interconnecting cables and then go through the Troubleshooting section in this manual.

We strongly recommend that you do not try to repair the equipment yourself and do not have the local repair shop attempt anything other than the simplest repair. If the repair is more complicated than a broken wire or loose connection, send the unit to the factory for repair and service. Don’t attempt to adjust any controls inside the units. Once set at the factory, the various controls and trimmers do not drift with age or vibration and never require readjustment. There are no adjustments inside that will make a malfunctioning unit start working.

LECTROSONICS’ Service Department is equipped and staffed to quickly repair your equipment. In warranty repairs are made at no charge in accordance with the terms of the warranty. Out-of-warranty repairs are charged at a modest flat rate plus parts and shipping. Since it takes almost as much time and effort to determine what is wrong as it does to make the repair, there is a charge for an exact quotation. We will be happy to quote approximate charges by phone for out-of-warranty repairs.

Returning Units for Repair

For timely service, please follow the steps below:

A. Do NOT return equipment to the factory for repair without first contacting us by email or by phone. We need to know the nature of the problem, the model number and the serial number of the equipment. We also need a phone number where you can be reached 8 A.M. to 4 P.M. (U.S. Mountain Standard Time).

B. After receiving your request, we will issue you a return authorization number (R.A.). This number will help speed your repair through our receiving and repair departments. The return authorization number must be clearly shown on the outside of the shipping container.

C. Pack the equipment carefully and ship to us, shipping costs prepaid. If necessary, we can provide you with the proper packing materials. UPS is usually the best way to ship the units. Heavy units should be “double-boxed” for safe transport.

D. We also strongly recommend that you insure the equipment, since we cannot be responsible for loss of or damage to equipment that you ship. Of course, we insure the equipment when we ship it back to you.

LIMITED ONE YEAR WARRANTY

The equipment is warranted for one year from date of purchase against defects in materials or workmanship provided it was purchased from an authorized dealer. This warranty does not cover equipment which has been abused or damaged by careless handling or shipping. This warranty does not apply to used or demonstrator equipment.

Should any defect develop, Lectrosonics, Inc. will, at our option, repair or replace any defective parts without charge for either parts or labor. If Lectrosonics, Inc. cannot correct the defect in your equipment, it will be replaced at no charge with a similar new item. Lectrosonics, Inc. will pay for the cost of returning your equipment to you.

This warranty applies only to items returned to Lectrosonics, Inc. or an authorized dealer, shipping costs prepaid, within one year from the date of purchase.

This Limited Warranty is governed by the laws of the State of New Mexico. It states the entire liability of Lectrosonics Inc. and the entire remedy of the purchaser for any breach of warranty as outlined above. NEITHER LECTROSONICS, INC. NOR ANYONE INVOLVED IN THE PRODUCTION OR DELIVERY OF THE EQUIPMENT SHALL BE LIABLE FOR ANY INDIRECT, SPECIAL, PUNITIVE, CONSEQUENTIAL, OR INCIDENTAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THIS EQUIPMENT EVEN IF LECTROSONICS, INC. HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. IN NO EVENT SHALL THE LIABILITY OF LECTROSONICS, INC. EXCEED THE PURCHASE PRICE OF ANY DEFECTIVE EQUIPMENT.

This warranty gives you specific legal rights. You may have additional legal rights which vary from state to state.
