Introduction

The SM Series variable power transmitters are the product of many years of engineering and experience in professional audio markets. The unique design provides several distinct features for professional applications:

- Selectable output power to maximize battery life or operating range as needed
- Superb, compandor-free audio quality
- Ultra-lightweight, corrosion resistant housing
- Water resistant seals for use in damp environments
- Programmable compatibility modes for use with a wide variety of different receivers

The Digital Hybrid Wireless® design (US Patent 7,225,135) combines 24-bit digital audio with analog FM resulting in a system that has the same operating range as analog systems, the same spectral efficiency as analog systems, the same long battery life as analog systems, plus the excellent audio fidelity typical of pure digital systems.

The SM Series transmitters feature the unique servo bias input circuitry with a standard TA5M type input jack for use with electret lavalier mics, dynamic mics, or line level signals. A water resistant control panel with LCD, membrane switches and multi-color LEDs make input gain adjustments, frequency and compatibility mode selection quick and accurate, without having to view the receiver. The battery compartment accepts AA lithium or rechargeable batteries. The housings are machined from solid aluminum blocks to provide an extremely lightweight and rugged package. A special non-corrosive finish resists salt water exposure and perspiration in extreme environments.

These ETSI compliant transmitters work with Digital Hybrid receivers in the Nu Hybrid mode, with Lectrosonics IFB receivers, and in a special Mode 3 for use with receivers from another manufacturer.

General Technical Description

Servo Bias Input

The voltage and current requirements of the variety of electret microphones used in professional applications has caused confusion and compromises in the wiring needed for wireless transmitters. To address this problem, the unique Servo Bias input circuit provides an automatically regulated voltage over a very wide range of current for compatibility with all microphones.

Digital Hybrid Wireless® Technology

All wireless links suffer from channel noise to some degree, and all wireless microphone systems seek to minimize the impact of that noise on the desired signal. Conventional analog systems use companders for enhanced dynamic range, at the cost of subtle artifacts (typically “pumping” and “breathing”). Wholly digital systems defeat the noise by sending the audio information in digital form, at the cost of some combination of power, bandwidth and resistance to interference.

Digital Hybrid systems overcome channel noise in a dramatically new way, digitally encoding the audio in the transmitter and decoding it in the receiver, yet still sending the encoded information via an analog FM wireless link. This proprietary algorithm is not a digital implementation of an analog compandor but a technique that can be accomplished only in the digital domain, even though the inputs and outputs are analog.

Because it uses an analog FM link, the Digital Hybrid system enjoys all the benefits of conventional FM wireless systems and it does away with the analog compandor and its artifacts.

No Pre-Emphasis/De-Emphasis

The Digital Hybrid design results in a signal-to-noise ratio high enough to preclude the need for conventional pre-emphasis (HF boost) in the transmitter and de-emphasis (HF roll off) in the receiver. This eliminates the potential for distortion of signals with abundant high-frequency information.

Low Frequency Roll-Off

The low frequency roll-off can be set for a 3 dB down point at 35, 50, 70, 100, 120 and 150 Hz to control subsonic and very low frequency audio content in the audio. The actual roll-off frequency will vary slightly depending upon the low frequency response of the microphone.

Excessive low frequency content can drive the transmitter into limiting, or in the case of high level sound systems, can even cause damage to loudspeaker systems. The roll-off is normally adjusted by ear while listening as the system is operating.

Input Limiter

A DSP-controlled analog audio limiter is employed before the A-D converter. The limiter has a range of more than 30 dB for excellent overload protection. A dual release envelope makes the limiter acoustically transparent while maintaining low distortion. It can be thought of as two limiters in series, a fast attack and release limiter followed by a slow attack and release limiter. The limiter recovers quickly from brief transients, with no audible side effects, and also recovers slowly from sustained high levels to keep audio distortion low while preserving short term dynamics.
Signal Encoding and Pilot Tone
In addition to controlling the limiter, the DSP also encodes the digitized audio from the A/D converter and adds an ultrasonic pilot tone to control the squelch in the receiver. A pilot tone squelch system provides a reliable method of keeping a receiver output muted (audio mute) even in the presence of significant interference. When the system is operating in the Nu Hybrid mode, a different pilot tone frequency is generated for each carrier frequency to prevent inadvertent squelch problems in multi-channel systems.

Microprocessor Control
A microprocessor monitors user command inputs from the control panel buttons and numerous other internal signals. It works intimately with the DSP to ensure the audio is encoded according to the selected Compatibility Mode and that the correct pilot tone is added to the encoded signal.

Compatibility Modes
SM Series ETSI compliant transmitters are designed to operate with Lectrosonics Digital Hybrid receivers in Nu Hybrid Mode and will yield the best performance when doing so. However, due to the flexibility of digital signal processing, the transmitters can also operate with Lectrosonics IFB receivers and in a special Mode 3 for use with receivers from another manufacturer. Contact the factory for details on this special mode.

Control Panel
The control panel includes four membrane switches and an LCD screen to adjust the operational settings. Multi-color LEDs are used to indicate audio signal levels for accurate gain adjustment and for battery status.

Wide-Band Deviation
±75 kHz deviation improves the signal to noise ratio and audio dynamic range of a wireless system dramatically, compared to other designs that use ±30 kHz to 40 kHz deviation. Wide deviation combined with a high powered transmitters makes a significant improvement in signal to noise ratio and operating range.

Variable Power Output
This advanced feature allows the operator to optimize the transmitter for maximum battery life, or for maximum operating range. Power output is selected using the LCD in a setup mode while the RF output of the transmitter is turned off.

Battery Options and Operating Time
Switching power supplies convert regulated battery voltages to operate various circuit stages with maximum efficiency.

Circulator/Isolator
The RF output circuit includes a one way circulator/isolator using a magnetically polarized ferrite. This device greatly reduces RF intermodulation produced when multiple transmitters are used in close proximity to one another (several feet apart). The isolator also provides additional RF output stage protection against static shock.
Controls and Functions

LCD Screen
The LCD is a numeric-type Liquid Crystal Display with screens for adjusting power, frequency, audio level and low frequency audio roll-off. The transmitter can be powered up with or without the RF output turned on. A countdown appears in the LCD when powering on and off, allowing the transmitter to be turned on without RF for adjustments, and to prevent accidentally turning it off with momentary button presses.

Power LED
The PWR LED glows green when the battery is good. The color changes to red when there is about 30 minutes of operation left with the recommended lithium battery. When the LED begins to blink red, there are only a few minutes of life.

The exact point at which the LED turns red will vary with battery brand and condition, temperature and current drain. The LED is intended to simply catch your attention, not to be an exact indicator of remaining time.

Power LED Off Feature
In normal operating mode, the DOWN and UP Arrow buttons may be used to turn the PWR LED indicators off and on. This setting does not persist through a power cycle nor does it affect the LCD backlight.

Audio Input Jack
The Servo Bias input circuitry accommodates virtually every lavaliere, handheld or shotgun microphone available, plus line level signals.

Battery Compartment and Thumb Screw
The large knurled thumbscrew is used to release or secure the Battery Compartment Cover Plate.

Modulation LEDs
Proper input gain adjustment is critical to ensure the best audio quality. Two bicolor LEDs will glow either red or green to accurately indicate modulation levels. The input circuitry includes a wide range DSP controlled limiter to prevent distortion at high input levels.

It is important to set the gain (audio level) high enough to achieve full modulation during louder peaks in the audio. The limiter can handle over 30 dB of level above full modulation, so with an optimum setting, the LEDs will flash red during use. If the LEDs never flash red, the gain is too low. In the table below, +0 dB indicates full modulation.

AUDIO Button
The AUDIO button is used to display the audio level and low frequency roll-off settings. The UP and DOWN arrows adjust the values.

The AUDIO button is also used with the FREQ button to enter standby mode and to power the transmitter on or off.

FREQ Button
The FREQ Button displays the selected operating frequency and toggles the LCD between displaying the actual operating frequency in MHz and a two-digit hexadecimal number that corresponds to the equivalent Lectrosonics Frequency Switch Setting.

Up/Down Arrows
The Up and Down arrow buttons are used to select the values on the various setup screens and to lock out the control panel.

Antenna
The transmitter uses a whip antenna with a flexible woven, galvanized steel mesh cable and a standard SMA connector.
Battery and Battery Eliminator Installation

Note: Standard zinc-carbon batteries marked “heavy-duty” or “long-lasting” are not adequate.

The battery status circuitry is designed for the voltage drop over the life of lithium batteries.

To install new batteries:
1. Turn the Battery Cover Plate Thumbscrew counterclockwise a few turns until the door will rotate.
2. Insert the new batteries into the housing. The positive (+) battery terminal goes into the transmitter first.
3. Align the Battery Cover Plate and tighten the Battery Cover Plate Thumbscrew.

To install the battery eliminator, loosen the thumbscrew completely and remove the battery door. Insert the battery eliminator and tighten the thumbscrew.

Attaching and Removing the Microphone

The flexible sleeve over the 5-pin plug on the microphone helps prevent dust and moisture from getting into the input jack. The flange around the rim of the connector on the transmitter helps retain the sleeve after it is installed and

The following procedure simplifies the attachment and removal of the microphone to assure the sleeve is seated securely.

Align the pins on the plug and jack and insert the connector.

1. If the sleeve is pulled down and covering the connector, squeeze the end of the sleeve so you can feel the connector inside and press it into the jack until it latches.

2. Pinch and squeeze the sleeve near the flange and work it down with a kneading motion over the flange all the way around until it stays in place flush with the housing. Pull on the connector to make sure it is firmly latched.

3. To remove the connector, pull the sleeve back to expose the black release button. Press the button to unlatch the plug.
Operating Instructions

Power Up and Boot Sequence

1) Ensure that good batteries are installed in the unit.
2) Simultaneously press and hold the AUDIO and FREQ buttons until the Power On Boot Sequence is initiated.

The count will progress from 1 through 3 and the unit will then power up with the RF output turned on. During this turn on sequence, the modulation and power LEDs all glow red, then green, and then revert to normal operation.

The LCD displays a bootup sequence which consists of four screens:
- Company Name: Lectro
- Frequency Block (bXX) and Firmware Version (rX.X): b21r1.1 (typ)
- Power Level: Pr 250
- Compatibility Mode: CP 400 (typ)
- Audio: Aud 12 (typ)

Power Down

Initial Power Off Timer Screen

1) Simultaneously press and hold the AUDIO and FREQ buttons while observing that the word “Off” appears in the LCD along with a counter.
2) When the counter reaches “0”, the unit turns off.

Note: If the AUDIO and FREQ buttons are released before the LCD goes blank at the end of the countdown, the unit will not turn off. Instead, it will stay energized and the display will return to the previous screen.

Standby Mode

With the power turned off, pressing the AUDIO and FREQ buttons briefly places the unit in Standby Mode. In this mode the RF output is turned off so all setup adjustments can be made without interfering with other systems operating in the same location. The screen displays “rf OFF” to remind the user that the unit is not transmitting.

While the unit is in the standby mode, access the setup screens using the AUDIO and FREQ buttons and make adjustments using the Up and Down arrows.

LCD Backlight Settings

The LCD backlight can be set to turn off after either 5 minutes or 30 seconds, or stay on continuously. Hold the UP arrow in while powering up the unit to enter the setup screen. Press the AUDIO button repeatedly to step through the setup items to reach the backlight settings screen. Use the UP or DOWN arrow button to select the desired setting.

Selecting Step Size mode

Hold the UP arrow in while powering up the unit to enter the setup screen. Press the AUDIO button repeatedly to step through the setup items to reach the Step Size Mode screen. Use the UP or DOWN arrow button to select the desired setting.

Selecting the Compatibility Mode and Output Power

The transmitter will work with Digital Hybrid receivers in the Nu Hybrid mode, Lectrosonics IFB receivers and in a special Mode 3 for use with receivers from another manufacturer.

1) Set the receiver’s audio controls to minimum.
2) From a power off condition, hold down the Up arrow, then simultaneously press the AUDIO and FREQ buttons.
3) Press either AUDIO or FREQ button to select the compatibility screen and use the Up and Down arrows to select the desired mode.

The following Compatibility Modes are available:
- Mode 3 (contact the factory for details): CP 3
- Nu Hybrid: CP Nu
- IFB Series mode: CP IFB

NOTE: If your Lectrosonics receiver does not have Nu Hybrid mode, set the receiver to Euro Digital Hybrid Wireless® (EU Dig. Hybrid).
4) Press either AUDIO or FREQ button to select the power setting screen and use the Up and Down down arrows to select the desired level of power.

5) Simultaneously press the AUDIO and FREQ buttons to exit this mode and turn off the power.

Audio Screen

The Audio screen is used to adjust input gain from 0 to +44 dB, and the low frequency roll-off from 35 to 150 Hz. Repeatedly pressing the AUDIO button toggles back and forth between the two displays. Press and hold the AUDIO button and use the Up and Down arrows to make adjustments.

Frequency Screen

The Frequency Screen displays the operating frequency in MHz or as a two-digit hexadecimal number that corresponds to the equivalent Lectrosonics Frequency Switch Setting. Repeatedly pressing the FREQ button toggles between the two displays. Press and hold the FREQ button and use the Up and Down arrows to select the frequency.

Lock/Unlock Screen

Simultaneously pressing and holding both the Up and Down arrow buttons during normal operation starts the Lock timer. The timer starts at three and counts down to zero. When the timer reaches zero, the transmitter’s controls are locked.

With the controls locked, the AUDIO and FREQ buttons can still be used to display current settings. Any attempt to change a setting by pressing either the Up or Down arrow button will result in an on-screen Loc reminder that the controls are locked. Remove the batteries to unlock the control panel.

Important: Once the transmitter is locked, it cannot be unlocked or powered off using the buttons. The only ways to unlock a locked transmitter are to remove the battery or unlock it via the RM remote control.

Remote Control Operation

The transmitters can be configured to respond to signals from the LectroRM app or to ignore them. This setting is accessed by holding Down arrow button while powering the transmitter on. Use the arrow keys to toggle between “rc on” (remote control on) and “rc oFF” (remote control off). The default setting is “rc on.”

If a remote control signal is detected but the transmitter is set to “rc oFF”, the message “rc oFF” will be displayed briefly on the transmitter’s LCD, to confirm that a valid signal was received, but that the transmitter is not configured to respond to it.

Remote functions available are:

- Tx Input Gain
- Sleep/Unsleep
- Lock/Unlock
- Frequency
- Tuning in 25 kHz steps
- Changing the low frequency roll-off setting
- Turning on/off the PWR and Audio LEDs
- Gain up/down functions

In sleep mode, the transmitter uses only 20% of the normal amount of battery drain. Sleep mode can only be invoked with the remote control, and can only be revoked with the remote control or by removing the battery. When in the sleep mode, the PWR LED blinks green every few seconds to indicate that the transmitter is asleep and not turned off.

NOTE: See LectroRM for more information.
Configuring for Power Restore

When using external power source through a battery eliminator, Power Restore will return your transmitter to settings it had before it was powered off. This eliminates the need to power on through the unit itself.

1) Press and hold the Down Arrow Button then power on the transmitter by pressing the Audio and Freq buttons simultaneously.
2) The LCD will display the status, either “rc ON” or “rc OFF.” Press “AUDIO” or “FREQ” key to scroll to the “PbAc setup screen
   • PbAc 1 for power restore ON
   • PbAc 0 for power restore OFF
3) When power restore is set to ON, the unit will turn on whenever power is present at the battery terminals until the power is manually turned off with the control panel switches.

   NOTE: The firmware “remembers” the power status when a battery fails, so the transmitter will be turned on automatically when the battery is replaced and the previous settings will be enabled.

Power Up and Boot Sequence

Setting Transmitter Operating Frequency

The frequency can be displayed either in MHz or as a two-digit hexadecimal number and can be set in the Standby Mode or when the transmitter is powered up. The hexadecimal numbering system is unique to Lectrosonics where two alphanumeric characters correspond to the left and right switch settings on earlier analog transmitters that had mechanical rotary switches to adjust frequency.

1) Press the FREQ button to select either the MHZ screen or the hexadecimal screen.
2) While holding the FREQ button, use the Up or Down arrow buttons to move the operating frequency up or down in 100 kHz increments from the current setting.

Note: The operating frequency displayed on the LCD wraps as it reaches the upper or lower end of its range.

Set Up in 100 kHz Mode

The Frequency Screen displays the operating frequency in MHz or as a two-digit hexadecimal number that corresponds to the equivalent Lectrosonics Frequency Switch Setting. The example of the two-digit display shown here indicates CH (channel) and 2C as the frequency. Repeatedly pressing the FREQ button toggles between the two displays. Press and hold the FREQ button and use the Up and Down arrows to select the frequency.

Set Up in 25 kHz Mode

The hexadecimal display in the 25 kHz mode will appear with a decimal suffix to indicate the 25 kHz steps.

Adjusting the Low Frequency Roll-off

Repeatedly press the AUDIO button until the LF roll-off adjustment screen appears. Then press and hold the AUDIO button while selecting the desired roll-off frequency with the UP and DOWN arrows.

The roll-off frequency can be set to 35, 50, 70, 100, 120 and 150 Hz.

Adjusting Audio Level (Gain)

The control panel Modulation LEDs indicate the audio level and limiter activity. Once set, the transmitter’s audio level setting should not be used to control the volume of your sound system or recorder levels. This gain adjustment matches the transmitter gain with the microphone’s output level, the user’s voice level and the position of the microphone. The audio input level (gain) is adjusted with the unit in the Standby Mode or while powered up while observing the LEDs.

It is desirable to set the gain so that some limiting occurs on louder peaks. The limiter is very transparent and its effect is not audible until the system is close to overload. In other words, don’t be shy about turning up the gain.
It is actually a good idea to turn the gain up to maximum and listen for distortion or compression to get a feel for how much headroom is available.

</tr>
</tbody>
</table>

Note: Different voices will usually require different gain settings, so check this adjustment as each new person uses the system. If several different people will be using the transmitter and there is not time to make the adjustment for each individual, adjust it for the loudest voice.

1) With the transmitter powered off, plug in the microphone and make sure the connector is firmly seated.

Warning: If the system is powered up while connected to a live sound system, be careful to turn the sound system level down first or severe feedback can occur.

2) Place the transmitter in Standby Mode or turn it on for normal use.

3) Position the microphone in the location where it will be used in actual operation.

4) Observe the Modulation LEDs while speaking or singing into the microphone at the same voice level that will be used during operation. While holding the AUDIO button, press the UP or DOWN arrow buttons until both the -20 and -10 LEDs glow green, with the -20 LED occasionally flickering red. This will maximize the signal to noise ratio of the system with full modulation and provide subtle limiting to prevent overload and audible compression.

5) If the unit was set up in Standby Mode, it will be necessary to turn the transmitter off, then power it up again in normal operation so the RF output will be on. Then the other components in the sound or recording system can be adjusted.

### Locking or Unlocking the Controls

The Lock mode protects the transmitter from accidental changes to its settings. Simultaneously press both the Up and Down arrow buttons to start the countdown timer. When the timer reaches zero, “Loc” is displayed and the controls are locked. Settings can be reviewed but not changed.

Once the transmitter is locked, it cannot be unlocked or powered off using the buttons. The only ways to unlock a locked transmitter are to remove the battery or unlock it using the remote control. The remote control will work only if the transmitter was previously configured to respond to the remote control. The unit will always power up in “unlocked” mode.

### 5-Pin Input Jack Wiring

The wiring diagrams included in this section represent the basic wiring necessary for the most common types of microphones and other audio inputs. Some microphones may require extra jumpers or a slight variation on the diagrams shown.

It is virtually impossible to keep completely up to date on changes that other manufacturers make to their products, thus you may encounter a microphone that differs from these instructions. If this occurs please call our toll-free number listed under Service and Repair in this manual or visit our web site at: www.lectrosonics.com

Audio input jack wiring:

**PIN 1** Shield (ground) for positive biased electret lavaliere microphones. Shield (ground) for dynamic microphones and line level inputs.

**PIN 2** Bias voltage source for positive biased electret lavaliere microphones.

**PIN 3** Low impedance microphone level input for dynamic microphones. Also accepts hand-held electret microphones provided the microphone has its own built-in battery.

**PIN 4** Bias voltage selector for Pin 3. Pin 3 voltage (0, 2 or 4 volts) depends on Pin 4 connection.

- Pin 4 tied to Pin 1: 0 V
- Pin 4 Open: 2 V
- Pin 4 to Pin 2: 4 V

**PIN 5** High impedance, line level input for tape decks, mixer outputs, musical instruments, etc.
Installing the Connector:

1) If necessary, remove old connector from microphone cable.
2) Slide Rubber Boot onto microphone cable with the large end facing away from the microphone. (See illustration above.)
3) If necessary, slide the 1/8-inch black shrink tubing onto the microphone cable. (This tubing is needed for some cables to ensure the cable fits snugly in the rubber boot.)
4) Use the resistors and connector included with this kit to configure the TA5F to your particular microphone. (See Wiring Diagrams below.) A length of .065 OD clear tubing is included if insulating the resistor leads or shield wire is necessary. (Remove rubber strain relief from connector backshell by pulling it out of the backshell.)
5) Slide the Strain Relief over the TA5F Insert and crimp as shown to the right. Then insert the TA5F Insert and Strain Relief in the TA5F Latchlock. Screw the TA5F Flex Relief onto the TA5F Latchlock.
6) If needed, position and shrink the 1/8-inch shrink tubing on the microphone cable, then slide the Rubber Boot down over the TA5F connector.

Microphone RF Bypassing

When used on a wireless transmitter, the microphone element is in the proximity of the RF coming from the transmitter. The nature of electret microphones makes them sensitive to RF, which can cause problems with the microphone/transmitter compatibility. If the electret microphone is not designed properly for use with wireless transmitters, it may be necessary to install a chip capacitor in the mic capsule or connector to block the RF from entering the electret capsule.

Some mics require RF protection to keep the radio signal from affecting the capsule, even though the transmitter input circuitry is already RF bypassed (see schematic diagram).

If the mic is wired as directed, and you are having difficulty with squealing, high noise, or poor frequency response, RF is likely to be the cause.

The best RF protection is accomplished by installing RF bypass capacitors at the mic capsule. If this is not possible, or if you are still having problems, capacitors can be installed on the mic pins inside the TA5F connector housing.

Line Level Signals

The normal hookup for line level signals is: Signal Hot to pin 5, Signal Gnd to pin 1 and pin 4 jumped to pin 1. This allows signal levels up to 3V RMS to be applied without limiting.

If more headroom is needed, insert a 20 k resistor in series with pin 5. Put this resistor inside the TA5F connector to minimize noise pickup.

2 WIRE MIC

Preferred locations for bypass capacitors

Install the capacitors as follows: Use 330 pF capacitors. Capacitors are available from Lectrosonics. Please specify the part number for the desired lead style.

Leaded capacitors: P/N 15117
Leadless capacitors: P/N SCC330P

All Lectrosonics lavaliere mics are already bypassed and do not need any additional capacitors installed for proper operation.
NOTE: This termination is intended for UHF transmitters only. VHF transmitters with 5-pin jacks require a different termination. Lectrosonics lavaliere microphones are terminated for compatibility with VHF and UHF transmitters, which is different than what is shown here.
Wiring Hookups for Different Sources

In addition to the microphone and line level wiring hookups illustrated below, Lectrosonics makes a number of cables and adapters for other situations such as connecting musical instruments (guitars, bass guitars, etc.) to the transmitter. Visit [www.lectrosonics.com](http://www.lectrosonics.com) and click on Accessories, or download the master catalog.

A lot of information regarding microphone wiring is also available in the FAQ section of the web site at: [http://www.lectrosonics.com](http://www.lectrosonics.com)

Hover over Support and click on FAQs. Follow the instructions to search by model number or other search options.

Compatible Wiring for Both Servo Bias Inputs and Earlier Transmitters:

**Fig. 1**

**2 VOLT POSITIVE BIAS 2-WIRE ELECTRET**

-Wiring for microphones such as Countryman B6 headworn and B8 lavaliere.

**Fig. 2**

**4 VOLT POSITIVE BIAS 2-WIRE ELECTRET**

-Most common type of wiring for lavaliere mics.

**Fig. 3**

**DANISH PRO AUDIO MINIATURE MODELS**

-Wiring for DPA lavaliere and headworn microphones.

**Fig. 4**

**2 VOLT NEGATIVE BIAS 2-WIRE ELECTRET**

-Compatible wiring for microphones such as negative bias TRAM models.

**Fig. 5**

**SANKEN COS-11 AND OTHERS**

-Also used for other 3-wire lavaliere microphones that require an external resistor.

**Fig. 6**

**LO-Z MICROPHONE LEVEL SIGNALS**

-For low impedance dynamic mics or electret mics with internal battery or power supply.

**Fig. 7**

**BALANCED AND FLOATING LINE LEVEL SIGNALS**

-If the output is balanced but center tapped to ground, such as on all Lectrosonics receivers, do not connect Pin 3 of the XLR jack to Pin 4 of the TA5F connector.

**Fig. 8**

**UNBALANCED LINE LEVEL SIGNALS**

-For signal levels up to 3V (+12 dBu) before limiting. Fully compatible with 5-pin inputs on other Lectrosonics transmitters such as the LM and UM Series. A 20k ohm resistor can be inserted in series with Pin 5 for an additional 20 dB of attenuation to handle up to 30V (+32 dBu).

**Simple Wiring - Can ONLY be used with Servo Bias Inputs:**

Servo Bias was introduced in 2005 and all transmitters with 5-pin inputs have been built with this feature since 2007.

**Fig. 9**

**2 VOLT POSITIVE BIAS 2-WIRE ELECTRET**

-Simplified wiring for microphones such as Countryman B6 lavaliere and B8 lavalier models and others.

**Fig. 10**

**2 VOLT NEGATIVE BIAS 2-WIRE ELECTRET**

-Simplified wiring for microphones such as negative bias TRAM models.

**Fig. 11**

**4 VOLT POSITIVE BIAS 3-WIRE ELECTRET**

-NOTE: This servo bias wiring is not compatible with earlier versions of Lectrosonics transmitters. Check with the factory to confirm which models can use this wiring.

**NOTE:** The resistor value can range from 2k to 4k ohms.

**NOTE:** All diagrams are illustrative and not to scale. Always refer to the product documentation for precise wiring instructions.
Silver Paste on SM Series Transmitter Thumbscrews

Silver paste is applied to thumbscrew threads on new units at the factory to improve the electrical connection from the battery compartment through the housing on any SM Series transmitter. This applies to the standard battery door and the battery eliminator.

Silver paste is applied to thumbscrew threads on new units at the factory to improve the electrical connection from the battery compartment through the housing on any SM Series transmitter. This applies to the standard battery door and the battery eliminator.

The small enclosed vial contains a tiny amount (25 mg) of silver conductive paste. A small speck of this paste will improve the conductivity between the battery cover plate thumbscrew and the case of the SM.

With improved conductivity (lower resistance), more of the battery voltage can get to the internal power supplies causing reduced current drain and longer battery life. Though the amount seems very small, it is enough for years of use. It is, in fact, 25 times the amount that we use on the thumbscrews at the factory.

To apply the silver paste, first completely remove the cover plate from the SM housing by backing the thumbscrew completely out of the case. Use a clean, soft cloth to clean the threads of the thumbscrew. Simply hold the cloth around the threads and turn the thumbscrew. Move to a new spot on the cloth and do it again. Do this until the cloth remains clean. Now, clean the threads in the case by using a dry cotton swab (Q-tip®) or equivalent. Again, clean the case threads until a fresh cotton swab comes away clean.

Open the vial, and transfer a pinhead speck of silver paste to the second thread from the end of the thumbscrew. A easy way to pickup a speck of paste is to partially unfold a paper clip and use the end of the wire to acquire a tiny bit of paste. A toothpick will also work. An amount that covers the end of the wire is sufficient.

Apply paste to second thread from end of thumbscrew

It is not necessary to spread the paste more than a little bit on the thread as the paste will spread itself every time the thumbscrew is screwed in and out of the case during battery changes.

Do not apply the paste to any other surfaces. The cover plate itself can be cleaned with a clean cloth by rubbing the slightly raised rings on the plate where it contacts the battery terminal. All you want to do is to remove any oils or dirt on the rings. Do not abrade these surfaces with a harsh material such as a pencil eraser, emery paper, etc., as this will remove the conductive nickel plating and expose the underlying aluminum, which is a poor contact conductor.

NOTE: Do NOT use alcohol or a liquid cleaner.
LectroRM

By New Endian LLC

LectroRM is a mobile application for iOS and Android operating systems. Its purpose is to remotely control Lectrosonics Transmitters, including:

- SM Series
- WM
- L Series

The app remotely changes settings on the transmitter through the use of encoded audio tones, which when received by the attached microphone, will alter the configured setting. The app was released by New Endian, LLC in September 2011. The app is available for download and sells for $20 on the Apple App Store and Google Play Store.

LectroRM’s remote control mechanism is the use of an audio sequence of tones (dweedles) that are interpreted by the transmitter as a configuration change. The settings available in LectroRM are:

- Audio Level
- Frequency
- Sleep Mode
- Lock Mode

User Interface

The user interface involves selecting the audio sequence related to the desired change. Each version has an interface for selecting the desired setting and the desired option for that setting. Each version also has a mechanism to prevent accidental activation of the tone.

iOS

The iPhone version keeps each available setting on a separate page with the list of options for that setting. On iOS, the “Activate” toggle switch must be enabled to show the button which will then activate the audio. The iOS version’s default orientation is upside-down but can be configured to orient right-side up. The purpose for this is to orient the device’s speaker, which is at the bottom of the device, closer to the transmitter microphone.

Android

The Android version keeps all settings on the same page and allows the user to toggle between the activation buttons for each setting. The activation button must be long pressed to activate. The Android version also allows users to keep a configurable list of full sets of settings.

Activation

For a transmitter to respond to remote control audio tones, the transmitter must meet certain requirements:

- The transmitter must not be turned off; it can however be in sleep mode.
- The transmitter must have firmware version 1.5 or later for Audio, Frequency, Sleep and Lock changes.
- The transmitter microphone must be within range.
- The transmitter must be configured to enable remote control activation.

Please be aware this app is not a Lectrosonics product. It is privately owned and operated by New Endian LLC, www.newendian.com.
**Straight Whip Antennas**

This is a full size cutting template used to cut the length of the whip for a particular frequency. Lay the uncut antenna on top of this drawing and trim the whip length to the desired frequency.

After cutting the antenna to the desired length, mark the antenna by installing a color cap or sleeve to indicate the color listed in the table below.

The supplied caps can be used several different ways:

1) A color cap on the end of the whip
2) A color sleeve next to the connector with a black cap on the end of the whip (trim the closed end of the colored cap off with scissors to make a sleeve).
3) A color sleeve and color cap (cut the cap in half with scissors).

---

**Notes:** Check the scale of your printout. This line should be 6.00 inches long (152.4 mm).

**NOTE:**

Not all Lectrosonics products are built on all of the blocks covered in this table.

Factory supplied antennas precut to length include a label with the frequency range. Label is not supplied with this kit.
Accessories for single battery models:

- **PSM** Leather pouch with integrated belt clip

- **SMBCUPSL** Spring-loaded machined aluminum clip

- **SMBCDN** Machined, wire belt clip for SMV transmitters, antenna down

- **SMBCUP** Machined, wire belt clip for SMV transmitters, antenna up

Accessories for dual battery models:

- **PSMD** Leather pouch with integrated belt clip

- **SMDBC** Machined, wire belt clip for SMQV transmitters

- **SMDBC SL** Spring-loaded machined aluminum clip

- **35924** Thermal insulated pad installed for SMQV

Place thermal insulation pad on back of unit, as pictured.
Accessories for Both Models

**SMBATELIM** External power adapter (battery eliminator) for all SM Series transmitters. 6 to 36 volt external sources. Handles up to 1 amp consumption. Protected against shorts and reverse polarity.

To install the battery eliminator, loosen the thumbscrew completely and remove the battery door. Insert the battery eliminator and tighten the thumbscrew.

**SMKTTA5** Microphone connector kit with watertight sleeve for all SM Series transmitters.
# Troubleshooting

Before going through the following chart, be sure that you have a good battery in the transmitter. It is important that you follow these steps in the sequence listed.

<table>
<thead>
<tr>
<th>SYMPTOM</th>
<th>POSSIBLE CAUSE</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRANSMITTER PWR LED OFF</td>

Specifications and Features

Operating frequencies:
- Block 470: 470.100 - 495.675
- Block 19: 486.400 - 511.975
- Block 20: 512.000 - 537.575
- Block 21: 537.600 - 563.175
- Block 22: 563.200 - 588.775
- Block 23a: 588.800 - 607.950

Channel Spacing: Selectable; 25 or 100 kHz

RF Power output: Selectable; 50, 100 or 250 mW

Compatibility Modes: Nu Hybrid, Mode 3, IFB

Pilot tone: 3.5 kHz deviation (Nu Hybrid)

Frequency stability: ± 0.002%

Sporous radiation: Compliant with ETSI EN 300 422-1 v1.4.2

Equivalent input noise: -125 dBV, A-weighted

Input level:
- If set for dynamic mic: 0.5 mV to 50 mV before limiting. Greater than 1 V with limiting.
- If set for electret lavaliere mic: 1.7 uA to 170 uA before limiting. Greater than 5000 uA (5 mA) with limiting.

Line level input:
- 17 mV to 1.7 V before limiting. Greater than 50 V with limiting.

Input impedance:
- Dynamic mic: 300 Ohms
- Electret lavaliere: Input is virtual ground with servo adjusted constant current bias

Line level:
- 2.7 k Ohms

Input limiter: Soft limiter, 30 dB range

Bias voltages: Fixed 5 V at up to 5 mA; Selectable 2 V or 4 V servo bias for any electret lavaliere.

Gain control range: 44 dB; panel mounted membrane switches

Modulation indicators: Dual bicolor LEDs indicate modulation of -20, -10, 0, +10 dB referenced to full modulation.

Controls: Control panel with LCD and four membrane switches.

Low frequency roll-off: Adjustable from 35 to 150 Hz.

Audio Frequency Response: 35 Hz to 20 kHz, +/-1 dB (The low frequency rolloff is adjustable - see graph on page 2)

Signal to Noise Ratio (dB):
- SmartNR: OFF 103.5 108.0
- NORMAL 107.0 111.5
- FULL 108.5 113.0

Total Harmonic Distortion: 0.2% typical (Nu Hybrid mode)

Audio Input Jack: Switchcraft 5-pin locking (TA5F)

Antenna: Flexible, unbreakable, detachable steel cable.

Batteries: 1.5 Volt AA (Lithium recommended)

Weight with Battery: SMV: 2.7 oz. (75.9 grams)

Overall Dimensions:
- SMV: 2.3 x 1.8 x 0.64 inches
- SMQV: 2.3 x 2.4 x 0.64 inches

Emission Designator: 110KF3E

Specifications subject to change without notice.
Service and Repair

If your system malfunctions, you should attempt to correct or isolate the trouble before concluding that the equipment needs repair. Make sure you have followed the setup procedure and operating instructions. Check the interconnecting cables and then go through the Troubleshooting section in this manual.

We strongly recommend that you do not try to repair the equipment yourself and do not have the local repair shop attempt anything other than the simplest repair. If the repair is more complicated than a broken wire or loose connection, send the unit to the factory for repair and service. Don’t attempt to adjust any controls inside the units. Once set at the factory, the various controls and trimmers do not drift with age or vibration and never require readjustment. There are no adjustments inside that will make a malfunctioning unit start working.

LECTROSONICS’ Service Department is equipped and staffed to quickly repair your equipment. In warranty repairs are made at no charge in accordance with the terms of the warranty. Out-of-warranty repairs are charged at a modest flat rate plus parts and shipping. Since it takes almost as much time and effort to determine what is wrong as it does to make the repair, there is a charge for an exact quotation. We will be happy to quote approximate charges by phone for out-of-warranty repairs.

Returning Units for Repair

For timely service, please follow the steps below:

A. DO NOT return equipment to the factory for repair without first contacting us by email or by phone. We need to know the nature of the problem, the model number and the serial number of the equipment. We also need a phone number where you can be reached 8 A.M. to 4 P.M. (U.S. Mountain Standard Time).

B. After receiving your request, we will issue you a return authorization number (R.A.). This number will help speed your repair through our receiving and repair departments. The return authorization number must be clearly shown on the outside of the shipping container.

C. Pack the equipment carefully and ship to us, shipping costs prepaid. If necessary, we can provide you with the proper packing materials. UPS is usually the best way to ship the units. Heavy units should be “double-boxed” for safe transport.

D. We also strongly recommend that you insure the equipment, since we cannot be responsible for loss of or damage to equipment that you ship. Of course, we insure the equipment when we ship it back to you.

LIMITED ONE YEAR WARRANTY

The equipment is warranted for one year from date of purchase against defects in materials or workmanship provided it was purchased from an authorized dealer. This warranty does not cover equipment which has been abused or damaged by careless handling or shipping. This warranty does not apply to used or demonstrator equipment.

Should any defect develop, Lectrosonics, Inc. will, at our option, repair or replace any defective parts without charge for either parts or labor. If Lectrosonics, Inc. cannot correct the defect in your equipment, it will be replaced at no charge with a similar new item. Lectrosonics, Inc. will pay for the cost of returning your equipment to you.

This warranty applies only to items returned to Lectrosonics, Inc. or an authorized dealer, shipping costs prepaid, within one year from the date of purchase.

This Limited Warranty is governed by the laws of the State of New Mexico. It states the entire liability of Lectrosonics Inc. and the entire remedy of the purchaser for any breach of warranty as outlined above. NEITHER LECTROSONICS, INC. NOR ANYONE INVOLVED IN THE PRODUCTION OR DELIVERY OF THE EQUIPMENT SHALL BE LIABLE FOR ANY INDIRECT, SPECIAL, PUNITIVE, CONSEQUENTIAL, OR INCIDENTAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THIS EQUIPMENT EVEN IF LECTROSONICS, INC. HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. IN NO EVENT SHALL THE LIABILITY OF LECTROSONICS, INC. EXCEED THE PURCHASE PRICE OF ANY DEFECTIVE EQUIPMENT.

This warranty gives you specific legal rights. You may have additional legal rights which vary from state to state.
